

Testimonial

“The RCPA Foundation Illumina Cancer Research Grant allowed us to sequence additional samples from the Australasian Leukaemia and Lymphoma Group, thereby increasing the power of our study. We have been able to establish a robust analysis platform using RNA-sequencing to identify differences in gene expression profiles and genetic mutations of acute myeloid leukaemias (AMLs) with inversion(16) and translocation(8;21). The results from this project will form the basis of future studies on genetic markers for poor outcomes in AMLs.”
